This invention describes a novel isolated polynucleotide (I) containing at least one sequence that (i) is 70% identical with a sequence that encodes at least one of 251 amino acid (aa) (3) or 108 aa (5) polypeptides; (ii) encodes a polypeptide at least 70% identical with (3) or (5); (iii) is the complement of (i) or (ii), or (iv) contains at least 50 consecutive bases from (i)-(iii). The invention also describes (a) protein derived from sequences of 753 bp (2) or 324 bp (4); (b) coryneform microorganisms, especially Corynebacterium, transformed with one or more (I), where these are replicative DNA; (c) production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            05-SEP-2001

(I) is used for transformation of coryneform bacteria being used for fermentative production of branched-chain amino acids, specifically leucine, isoleucine and valine, which are useful in medicine and animal nutrition. (I) can also be used as source of primers and probes for isolation of related sequences. Transformation with (I) increases yield of branched-chain amino acids. This sequence encodes the corynebacterium glutamicum ATCC 14752 brnF protein described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                       361
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 181

                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nakagawa

New export genes from coryneform bacteria, useful for increasing fermentative production of branched-chain amino acids.

23pp; German

This invention describes a novel isolated polynucleotide (I) containing at least one sequence that (i) is 70% identical with a sequence that CC encodes at least one of 251 amino acid (aa) (3) or 108 aa (5) colypeptides; (ii) encodes a polypeptide at least 70% identical with (3) cor (5); (iii) is the complement of (i) or (ii), or (iv) contains at least CC 15 consecutive bases from (i)-(ii). The invention also describes (a) protein derived from sequences of 753 bp (2) or 324 bp (4); (b) cc coryneform microorganisms, especially Corynebacterium, transformed with CC one or more (I), where these are replicative DNA; (c) production of CC one or more (I), where these are replicative DNA; (c) production of CC branched-chain L-aa by fermentation of coryneform bacteria in which the brnE and/or brnF genes (or equivalent sequences) are amplified, coryneform bacteria being considered. (I) is used for transformation of coryneform bacteria being considered for fermentative production of branched-chain amino acide, and corynebacterium medicine corynebacterium strition. (I) can also be used as source of primers and corynebacterium glutamicum ATCC 14752 brnF and brnE proteins described in the corynebacterium glutamicum ATCC 14752 brnF and brnE proteins described in the corynebacterium glutamicum ATCC 14752 brnF and brnE proteins described in the corynebacterium glutamicum ATCC 14752 brnF and brnE proteins described in the corynebacterium glutamicum ATCC 14752 brnF and brnE proteins described in the corynebacterium glutamicum ATCC 14752 brnF and brnE proteins described in method of the invention

Sequence 1271 BP; 265 A; 328 C; 318 G; 360 T; 0 U; 0 Other;

Length 1271;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
This invention describes a novel isolated polynucleotide (I) containing at least one sequence that (i) is 70% identical with a sequence that encodes at least one of 251 mmino acid (aa) (3) or 108 aa (5) polypeptides; (ii) encodes a polypeptide at least 70% identical with (3) or (5); (iii) is the complement of (i) or (ii), or (iv) contains at least 15 consecutive bases from (i) - (iii). The invention also describes (a) protein derived from sequences of 753 bp (2) or 324 bp (4); (b) coryneform microorganisms, especially Corynebacterium, transformed with one or more (I), where these are replicative DNA; (c) production of branched-chain I-aa by fermentation of coryneform bacteria in which the especially overexpressed; and (d) method for isolating the brnE and/or brnF genes. (I) is used for transformation of coryneform bacteria being used for fermentative production of branched-chain amino acids,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               L-amino acid production; brnF; brnE; branched-chain amino acid; coryneform bacterium; leucine; isoleucine; valine; medicine; animal nutrition; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   specifically leucine, isoleucine and valine, which are useful in medicine and animal nutrition. (I) can also be used as source of primers and probes for isolation of related sequences. Transformation with (I) increases yield of branched chain amino acids. This sequence encodes the Corynebacterium glutamicum ATCC 13032 brnF and brnE proteins described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1271 BP; 265 A; 328 C; 318

                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium. And identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, patticularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nakagawa

New nucleic acid array useful for monitoring mRNA expression of Corynebacterium glutamicum during fermentation, comprising nucleic acid from Corynebacterium glutamicum.

Claim 1; Page 647; 709pp; German.

This invention describes a novel nucleic acid array involving Corynebacterium glutamicum polynucleotides. The arrays are used to analyse C. glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the invention

(I) is used to transform coryneforms for production of L-amino acids, specifically lysine and isolatorine, which are used in medicine and particularly as animal feed supplement. It may also be used as probes and primers for isolating related sequences. Regulating expression of (I) improves production of amino acids, especially of L-lysine. This sequence encodes a fragment of the Corynebacterium glutamicum lrp protein which is used in the method described in the invention

(1) is used to transform coryneforms for production of L-amino acids, specifically lysine and isolaucine, which are used in medicine and particularly as animal feed supplement. It may also be used as probes and primers for isolating related sequences. Regulating expression of (1) improves production of amino acids, especially of L-lysine. This sequence encodes a fragment of the Corynebacterium glutamicum lrp protein which is used in the method described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 3; Page 17; 22pp; German.

Novel polynuclectides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene

Claim 8; SEQ ID NO 3408; 246pp + Sequence Listing; English.

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office Sequence 711 BP; 123 A; 190 C; 198 G; 200 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                    This invention describes a novel nucleic acid array involving Corynabacterium glutamicum polynucleotides. The arrays are used to analyse C. glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        592
```

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained patent did not form part of the printed specification, but was obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 309400 BP; 70133 A; 86477 C; 83115 G; 69675 T; 0 U; 0 Other;

The arrays are used to corynebacterium glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of different strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel isolated nucleic acid (I) from coryneform bacteria used for the fermentative production of selected L-amino acids, by fermenting the amino acid-producing coryneform in which at least the lrp gene has been weakened or amplified, then isolating amino acids that have accumulated in the medium or cells. (I) is used to transform coryneforms for production of L-amino acids, specifically lysine and isolaucine, which are used in medicine and particularly as animal feed supplement. It may also be used as probes and primers for isolating related sequences. Regulating expression of (I) improves production of amino acids, especially of L-lysine. This sequence encodes the Corynebacterium glutamicum lrp protein which is used in the method

FEFEXSKOOODDOODDOXX Identifying at least pathogenic infection bacterial, fungal or gene expression. one gene involved in plant resistance or response for conferring resistance or tolerance to a plant viral infection by determining or detecting plant 0 0

27; SEQ ID NO 5263; 899pp; English.

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.

The invention relates to subunits of cellulose synthetic equipment, that can be used to increase the amount of cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A gene encoding a cellulose synthetic equipment - for the improvement in the amount of cellulose synthesized in a plant body.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        JP2000060568-A.

; Sequence 6, Application US/09471803A
; Patent No. 661345
; Patent No. 661345
; Patent No. 661345
; Patent INFORMATION:
; APPLICANT: KENNERKNECHT, NICOLE
; APPLICANT: SAHM, HERMANN
; APPLICANT: EGGELING, LOTHAR
; APPLICANT: PREFFERLE, WALTER
; TITLE OF INVENTION: NUCLECTIOE SEQUENCE CODING FOR THE EXPORT OF
; TITLE OF INVENTION: BRANCHED CHAIN AMINO ACIDS, PROCESS FOR THE
; TITLE OF INVENTION: ISOLATION THEREOF AND USE THEREOF
; TITLE REFERENCE: 21123/265496/MAS
; CURRENT APPLICATION NUMBER: US/09/471,803A
; CURRENT FILING DATE: 1999-12-23
; PRIOR APPLICATION NUMBER: DE 199
; PRIOR APPLICATION NUMBER: DE 199
; PRIOR FILING DATE: 1999-10-27
; NUMBER OF SEQ ID NOS: 12

```
; Sequence 3016, Application US/09489039A
; Patent No. 6610836
; GENERAL INFORMATION:
APPLICATI: Gary Breton et. al
iTITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO K
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.2004001
; CURRENT APPLICATION NUMBER: US/09/489,039A
; CURRENT APPLICATION NUMBER: US/09/489,039A
; CURRENT FILING DATE: 2000-01-27
; PRIOR APPLICATION NUMBER: US 60/117,747
; PRIOR APPLICATION NUMBER: US 60/117,747
; PRIOR FILING DATE: 1999-01-29
; NUMBER OF SEQ ID NOS: 14342
; SEQ ID NO 3016
; LENGTH: 756
; TYPE: DNA
; ORGANISM: Klebsiella pneumoniae
